
Kimi: new complete four-condition block (n=1 each); original eight-block primary dataset unchanged. GLM n=6 / V4 n=9 retain original arrays.
Full endpoints differ: Kimi selected loader call; GLM/V4 Worker outer loading flow. Descriptive comparison, not identical atomic boundaries.
Eight-rank envelope = latest end - earliest begin; no added CUDA sync. Envelopes may overlap: do not sum bars or interpret them as pure disk I/O.
